

Does your property pass OSHA's fall-protection rule?

Since January 2017, OSHA's Walking-Working Surfaces standard (29 CFR 1910, Subpart D) has applied to nearly every commercial property in Florida — floors, stairs, ramps, loading docks, roof access, and fall-protection anchorages. The general-industry trigger is just **4 feet**.

One accountable team: we certify it, and we fix it.

- **FL State Certified Engineer (engineering):** performs and SEALS the engineered inspections and the 5,000-lb anchor certifications.
- **La Gala (contractor):** self-performs the restoration that brings the surface into compliance, including Complete Building Code Compliant Recertifications — no hand-offs.

What we self-perform

- **Spalled / slick / cracked surfaces** → concrete restoration + slip-resistant urethane/epoxy traffic coating
- **Standing water / poor drainage** → waterproofing membrane, slope correction, drainage repair
- **Deteriorated stairs** → tread & nosing rebuild, handrails and guardrails
- **Unprotected roof/deck edges** → guardrail, hole covers, fall-protection anchor points
- **Uncertified rope-descent anchorages** → anchor install / replacement (the engineer seals the certification)

The recurring obligation — §1910.27

Each anchorage must hold 5,000 lb in any direction per worker; the owner must keep a written certification, inspect annually, and re-test at least every 10 years. We manage the whole cycle — so you stay compliant and budgeted.

FREE walking-surface assessment — know where you stand before an inspector does.

A no-obligation walkthrough against the Subpart D checklist, with written documentation for your file.
